

SPAGNA San Bartolomé «GEOLOGIA RURBANA»

«RURBAN GEOLOGY»

In the island of Lanzarote two ways of volcanic landscape transformation converge: the rhythm of the earth and the rhythm of human life. We can talk about coexistence and overlapping of changing processes that belong to different scales: the geological and the urban one. The agriculture has turned people into powerful agents of *displacement of material*, as powerful as the wind which they protect themselves from.

The project takes the idea of accumulation and overlapping of layers in the landscape construction. We take the reference of a geological section from a site adjacent to our sector for the development of the proposal, planning a *perforated basement* and an architecture that has the ability of recognizing the strata in which it is inserted.
